| Q.25 | As temperature increases |
| :--- | :--- |
| (A) | the dynamic viscosity of a gas increases. |
| (B) | the dynamic viscosity of a liquid decreases. |
| (C) | the dynamic viscosity of a liquid does not change. |
| (D) | the dynamic viscosity of a gas decreases. |

| Q.26 | Which of the following statement(s) regarding a venturimeter is/are correct? |
| :--- | :--- |
| (A) | In the direction of flow, it consists of a converging section, a throat, and a <br> diverging section. |
| (B) | In the direction of flow, it consists of a diverging section, a throat, and a <br> converging section. |
| (C) | It is used for flow measurement at a very low Reynolds number. |
| (D) | Pressure tappings are provided just upstream of the venturimeter and at the throat. |

GATE 2022 Engineering Sciences XE

| Q.27 | Which of the following statement(s) is/are true for streamlines in a steady <br> incompressible flow? |
| :--- | :--- |
| (A) | Two streamlines cannot intersect each other. |
| (B) | Flow rate increases between two diverging streamlines. |
| (C) | Flow rate decreases between two diverging streamlines. |
| (D) | Stream function has a constant value along a streamline. |

| Q.28 | A flow has a velocity potential given by $\phi=A x^{3}$ where ' $A$ ' is a non-zero <br> constant. Which of the following statement(s) is/are true about the flow? |
| :--- | :--- |
| (A) | The flow is incompressible. |
| (B) | The flow is irrotational. |
| (C) | The flow has local acceleration. |
| (D) | The flow has convective acceleration. |

| (B) | Compressional heating balances radiative cooling. |
| (C) | Radiative cooling balances heating due to viscous dissipation of kinetic energy. |
| (D) | Condensational heating balances adiabatic cooling. |

| Q.159 | Which one of the following processes is primarily responsible for the poleward <br> transport of energy in the midlatitude troposphere? |
| :--- | :--- |
|  |  |
| (A) | atmospheric tides |
| (B) | baroclinic waves |
| (C) | gravity waves |
| (D) | turbulence in the boundary layer |

## GATE

GATE 2022 Engineering Sciences XE

| Q.160 | Which of the following feature(s) characterize the seasonal mean flow in the <br> upper troposphere near 200 hPa level over the Tibetan Plateau during the boreal <br> summer? |
| :--- | :--- |
|  |  |
| (A) | cyclonic |
| (B) | anticyclonic |
| (C) | irrotational |
| (D) | divergent |

| Q.161 | The Rossby number of a synoptic system with a length scale of 1000 km, <br> characteristic velocity scale of $10 \mathrm{~m} \mathrm{~s}^{-1}$ at a latitude where the Coriolis parameter <br> equals $10^{-4} \mathrm{~s}^{-1}$, is $\quad . \quad$ (Round off to two decimal places) |
| :--- | :--- |

Q. 162 The ratio of scattering efficiency of red light of wavelength $0.65 \mu \mathrm{~m}$ to blue light of wavelength $0.45 \mu \mathrm{~m}$ by air molecules in the atmosphere is $\qquad$ . (Round off to two decimal places)

GATE 2022 Engineering Sciences XE
Q. 163 - Q. 175 Carry TWO marks Each

| Q. 163 | An unsaturated moist air parcel undergoes adiabatic ascent in atmosphere without mixing with surrounding air. Air is so clean that there is no possibility for heterogeneous nucleation. Which one of the following plots depicts the vertical variation of water vapor pressure (shown as continuous line) and saturation water vapor pressure (shown as dotted/dashed line) of the parcel? |
| :---: | :---: |
|  |     |
| (A) | P |
| (B) | Q |
| (C) | R |
| (D) | S |

GATE 2022 Engineering Sciences XE

| Q.164 | A fluid is in solid body rotation in a cylindrical container of radius $R$ rotating with <br> an angular velocity $\Omega=(0,0, \Omega)$. The circulation per unit area around a circular <br> loop in the horizontal plane of radius $r(r<R)$, whose center coincides with the <br> axis of rotation is |
| :--- | :--- |
|  |  |
| (A) | $2 \Omega$ |
| (B) | $\Omega^{2}$ |
| (C) | $\Omega / 2$ |
| (D) | $\Omega / 4$ |
| Q.165 | Consider a layer of atmosphere where temperature increases with height. If the <br> concentration of a vertically well-mixed greenhouse gas suddenly increases in this <br> layer, then an immediate consequence is that |
| (B) | infrared radiation leaving the top of the layer decreases. |
| (C) | infrared radiation leaving the top of the layer increases. |
| (D) | the layer becomes optically thinner to infrared radiation. |
| (A) |  |

GATE 2022 Engineering Sciences XE

GATE 2022 Engineering Sciences XE

| Q.168 | Which of the following statement(s) is/are true about northern hemisphere <br> tropical cyclones? |
| :--- | :--- |
|  |  |
| (A) | They have a warm core. |
| (B) | Their low-level flow is cyclonic. |
| (C) | Strong wind shear in the vertical is required for their intensification. |
| (D) | They are characterized by upper-level divergence. |
| Q.169 | In gradient wind balance, which of the following statement(s) is/are true for flow <br> around a region of low pressure in the northern hemisphere? |
| (B) |  |
| (D) | The flow is anti-clockwise. |
| The wlow is clockwise. |  |
| (D) | The wand speed is faster than the geostrophic wind. |

GATE 2022 Engineering Sciences XE

| Q. 170 | Which of the following statement(s) is/are true regarding biogeochemical cycle <br> in the ocean? |
| :--- | :--- |
|  |  |
| (A) | Shutdown of the biological pump in the ocean would have resulted in higher <br> $\mathrm{CO}_{2}$ concentration in the atmosphere compared to present-day. |
| (B) | If atmospheric $\mathrm{CO}_{2}$ concentration increases, solubility pump would lead to a <br> decrease in dissolved inorganic carbon in the ocean. |
| (C) | All carbon sequestered by marine photosynthesis settles down on the ocean floor <br> as organic matter. |
| (D) | Calcification (the process of making shells and skeletons) by marine organisms <br> in the surface ocean layer would lead to an increase in the surface ocean $\mathrm{CO}_{2}$. |

Q. 171 Consider the atmosphere to be a heat engine, which converts absorbed radiation to kinetic energy of winds. Let the global mean radiation absorbed be $200 \mathrm{Wm}^{-2}$. In steady-state, if the global mean kinetic energy dissipation is $10 \mathrm{Wm}^{-2}$, then the efficiency of the atmospheric heat engine is $\qquad$ $\%$.
(Round off to one decimal place)
Q. 172

A drifter on the surface of the ocean performs inertial oscillation. The speed of the drifter is $2 \mathrm{~m} \mathrm{~s}^{-1}$ and the Coriolis parameter at the latitude is $2 \times 10^{-4} \mathrm{~s}^{-1}$. The radius of the inertial oscillation is $\qquad$ km . (Round off to the nearest integer)

GATE 2022 Engineering Sciences XE
Q. 173 Consider a tornado in cyclostrophic balance. The tangential wind speed at a radial distance of 500 m from the center of the tornado is $\qquad$ $\mathrm{m} \mathrm{s}^{-1}$, if the pressure gradient at that location in the radial direction is $5 \mathrm{~N} \mathrm{~m}^{-3}$. Assume the density of air to be $1 \mathrm{~kg} \mathrm{~m}^{-3}$. (Round off to the nearest integer)
Q. 174 Consider two weather stations A and B having the same altitude. Station B is 5 km north of Station A and is always 2 K warmer than Station A. A steady northerly wind blows at $1 \mathrm{~m} \mathrm{~s}^{-1}$. The change in temperature at Station $A$ in 2 hours is
$\qquad$ K. (Round off to one decimal place)
Q. 175

Assume the Earth is in radiative equilibrium with effective radiative temperature of 255 K . If the planetary albedo increases by 0.05 , then the effective radiative temperature of the planet will be $\qquad$ K. (Round off to the nearest integer)

Given:
Solar constant $=1370 \mathrm{Wm}^{-2}$
Stefan Boltzmann constant $=5.67 \times 10^{-8} \mathrm{Wm}^{-2} \mathrm{~K}^{-4}$
