The profit on one necklace is ₹ 100 and the profit on one bracelet is ₹ 300.

Let the profit (the objective function) be  $Z$ , which has to be maximized.

Therefore, required LPP is

The normal equations are  $\sum y = na + b\sum x$  and  $\sum xy = a\sum x + b\sum x^2$

Since,  $\sum x = 0$  i.e., deviation from actual mean is zero,

$$\text{we have } a = \frac{\sum y}{n} = \frac{57}{11} = 5.18, b = \frac{\sum xy}{\sum x^2} = \frac{76}{110} = 0.69$$

Therefore, the required equation of the trend line  $y = 5.18 + 0.69x$

The trend values are

$$y = ax^2 + bx + c$$

Owl passes through the points (1,2), (2,1) and (4,5). So, it must satisfy the given equation

Therefore,

$$2 = a + b + c$$

$$1 = 4a + 2b + c$$

$$5 = 16a + 4b + c$$

$$\text{Now, } D = \begin{vmatrix} 1 & 1 & 1 \\ 4 & 2 & 1 \\ 16 & 4 & 1 \end{vmatrix} = 1(2-4) - 1(4-16) + 1(16-32) = -6 \neq 0$$

$$D_a = \begin{vmatrix} 2 & 1 & 1 \\ 1 & 2 & 1 \\ 5 & 4 & 1 \end{vmatrix} = 2(2-4) - 1(1-5) + 1(4-10) = -6$$

$$D_b = \begin{vmatrix} 1 & 2 & 1 \\ 4 & 1 & 1 \\ 16 & 5 & 1 \end{vmatrix} = 1(1-5) - 2(4-16) + 1(20-16) = 24$$

$$\text{and } D_c = \begin{vmatrix} 1 & 1 & 2 \\ 4 & 2 & 1 \\ 16 & 4 & 5 \end{vmatrix} = 1(10-4) - 1(20-16) + 2(16-32) = -30$$

$$\therefore a = \frac{D_a}{D} = \frac{-6}{-6} = 1; \quad b = \frac{D_b}{D} = \frac{24}{-6} = -4; \quad c = \frac{D_c}{D} = \frac{-30}{-6} = 5$$

Therefore, equation of the curve is  $y = x^2 - 4x + 5$

34. Let us consider demand function be  $p = D(x) = ax + b \dots \dots (i)$

When  $x = 25$  then  $p = 20000$

From equation (i), we have  $20000 = 25a + b \dots \dots (ii)$

1/2

And when  $x = 125$  then  $p = 15000$

From equation (i), we have  $15000 = 125a + b \dots \dots (ii)$

1/2

On solving equations (i) and (ii), we get  $a = -50$  and  $b = 21250$

1

Therefore, demand function,  $p = D(x) = -50x + 21250$

1/2

For equilibrium point  $D(x_0) = S(x_0)$

$$\Rightarrow -50x_0 + 21250 = 100x_0 + 7000$$

$$\Rightarrow -150x_0 = -14250$$

$$\Rightarrow x_0 = 95$$

On putting value of  $x_0$  in demand function and supply function, we get

$$p_0 = 16500$$

$\therefore$  Consumer surplus (CS)

$$= \int_0^{x_0} D(x)dx - p_0x_0$$

$$= \int_0^{95} (-50x + 21250)dx - 16500 \times 95$$

$$= \left( -50 \frac{x^2}{2} + 2150x \right)_0^{95} - 1567500$$

The payments into sinking fund consisting of 10 annual payments at the rate 7% per year is given by
